About the Author

Dr. Abhilaksh Likhi

Dr. Abhilaksh Likhi is a member of the Indian Administrative Service. He is a Fulbright Hubert. H. Humphrey Fellow and holds a Masters in International Public Policy from SAIS, Johns Hopkins University, Washington DC. He also holds a PhD in Development Communication from Jamia Millia Islamia University, New Delhi. He has served as a Short-Term Consultant at the World Bank. In the Government of Haryana, he last held the assignment of Principal Secretary, Agriculture for over two years. After having served as Joint Secretary, he is currently posted as Additional Secretary in the Ministry of Agriculture & Farmers Welfare, Government of India. He regularly contributes articles and papers on agriculture in leading publications. The views expressed are personal.

MICHIGAN STATE UNIVERSITY | Extension

Foreword from Michigan State University, USA

Michigan State University Extension (MSUE) and the National Institute of Agricultural Extension Management (MANAGE), India have had a long history of collaboration in strengthening agricultural extension systems in developing countries. We have been jointly organizing international training programs, conferences and developing joint publications to share our knowledge and experiences in the field of agricultural extension. On February 21, 2021, MSUE and MANAGE jointly published a new book ***"Innovations in Agricultural Extension"*** which was widely disseminated to agricultural extension professionals all over the world.

Experiences from all over the world suggest that farmer organizations (farmer cooperatives, farmer producer companies, commodity groups, etc.) play a critical role in the empowerment of smallholder and commercial farmers. The aggregation of farmers into Farmers Producer Organisations (FPOs) or Farmers Producer Companies (FPCs) is gaining momentum in India and in many developing countries in order to ensure better income for the farmers. The Farmers Producer Companies (FPCs) movement is gaining importance in empowering small and marginal farmers access to credit, inputs, new technologies and extension services in India. The aggregation of farmers into FPCs has been suggested as the way to eliminate constraints faced by farmers and other stakeholders in the agricultural value chain. Further, FPCs are playing a key role in enhancing the resilience of sustainable food systems through the promotion of good agricultural practices and enhanced grades, quality and safety standards. The lessons and experiences of FPCs in India are highly relevant for many developing countries who strive to empower small and marginal farmers.

This publication, second in the series, titled ***"Farmer Producer Companies-led Sustainable Agriculture through Organic Farming in India: Issues and Way Forward"*** by Dr. Abhilaksh Likhi, Additional Secretary in the Ministry of Agriculture and Farmers Welfare, Government of India is very timely and informative for stakeholders in developing countries who are engaged in empowering resource poor farmers. This publication provides a thorough review of the role of FPCs in providing market access, best practices through cluster approach, government schemes and shares experiences from various models of farming towards building sustainable agri-food systems.

I appreciate Dr. Abhilaksh Likhi for his timely contribution on the topic of FPCs which is gaining importance in India and in many developing countries. This publication will provide valuable inputs for the forthcoming "United Nations Food Systems Summit 2021" scheduled in September 2021 and will help agricultural professionals across the world to enhance their knowledge on strengthening FPCs in order to connect smallholder farmers to local, regional and international markets.

Michigan State University is looking forward to an expanded collaboration with MANAGE and other global partners.

ABSTRACT

This review paper attempts to delineate the role of Farmer Producer Companies (FPCs) in empowering small and marginal farmers to strengthen nutritional security through the sustainable agricultural practice of organic farming. It further focuses on pre and post FPC formation key issues raised by experts that hinder FPCs effective participation in the agricultural value chain. In this context, it also highlights FPC best practices from across the country emphasizing the criticality of factors in organic farming such as the cluster approach, nutrient management, quality control, social inclusion and use of appropriate technologies. It also points to the dire need of making access to credit easy by strengthening Bank-FPC linkages. Finally, the paper suggests the way forward to strengthen organic farming FPCs at the last mile by fostering synergies with *Panchayati Raj Institutions* (PRIs) and *Krishi Vigyan Kendras* (KVKs) in agriculture produce clusters.

FARMER PRODUCER COMPANIES-LED SUSTAINABLE AGRICULTURE THROUGH ORGANIC FARMING IN INDIA: ISSUES AND WAY FORWARD

INTRODUCTION

The 'agriculture sector'[i] in India is a critical source of livelihood, especially in the vast rural geographies of the country. It plays a key role in making the nation food secure and generating exportable surpluses. Ever since the country's independence and the onset of the Green Revolution[ii], the sector has been undergoing structural change in respect to farm size, cropping patterns and its share in the 'Gross Value Added (GVA).'[iii] As per 'provisional estimates 2020-21, it accounts for 20.2% of the country's GVA.'[iv] As per the Census 2011 54.6% of the total workforce in the country is still engaged in this sector. Approximately 85% of the operational holdings of farmers are small and marginal i.e., holdings of less than two hectare (and in some regions dependent on 'rainfed farming'[v]). The size of these operational holdings is continuously declining, raising serious questions on survivability of these small holders (Pandey, et. al., 2010). Despite this constraint, the country's food grain production as per 'advanced estimates 2020-21 has touched an all-time high of 305.44 million tonnes and it has, infact, been surpassed by horticulture production of 329.86 million tonnes.'[vi]

Agriculture is a 'state subject',[vii] yet the central and state governments, in conjunction, have been active facilitators of the process of agricultural development. This includes strengthening of 'agricultural marketing infrastructure'[viii] (rural roads, wholesale and periodic markets etc), 'research and development'[ix] and outreach to farmers through technology ('direct benefit transfers'[x] and 'electronic national market'[xi]) across the country. Besides, nurturing an apt ecosystem of incubation has enabled innovative agricultural 'start-ups'[xii] to take roots.

In the recent decades, a few important trends have been witnessed. Change in lifestyles and consumption habits, in both rural and urban areas, has led to diversification in consumer diets. There is increasing substitution of traditional staples e.g., rice and wheat by non-staples such as fruits, vegetables, millets, other coarse cereals, livestock, organic and processed products. As a result, issues of 'nutritional security i.e., access to diverse foods'[xiii] have come into sharp focus. An

effective food system, thus, needs to enable nutrition secure citizens to have the opportunity to improve their health through a balanced diet.

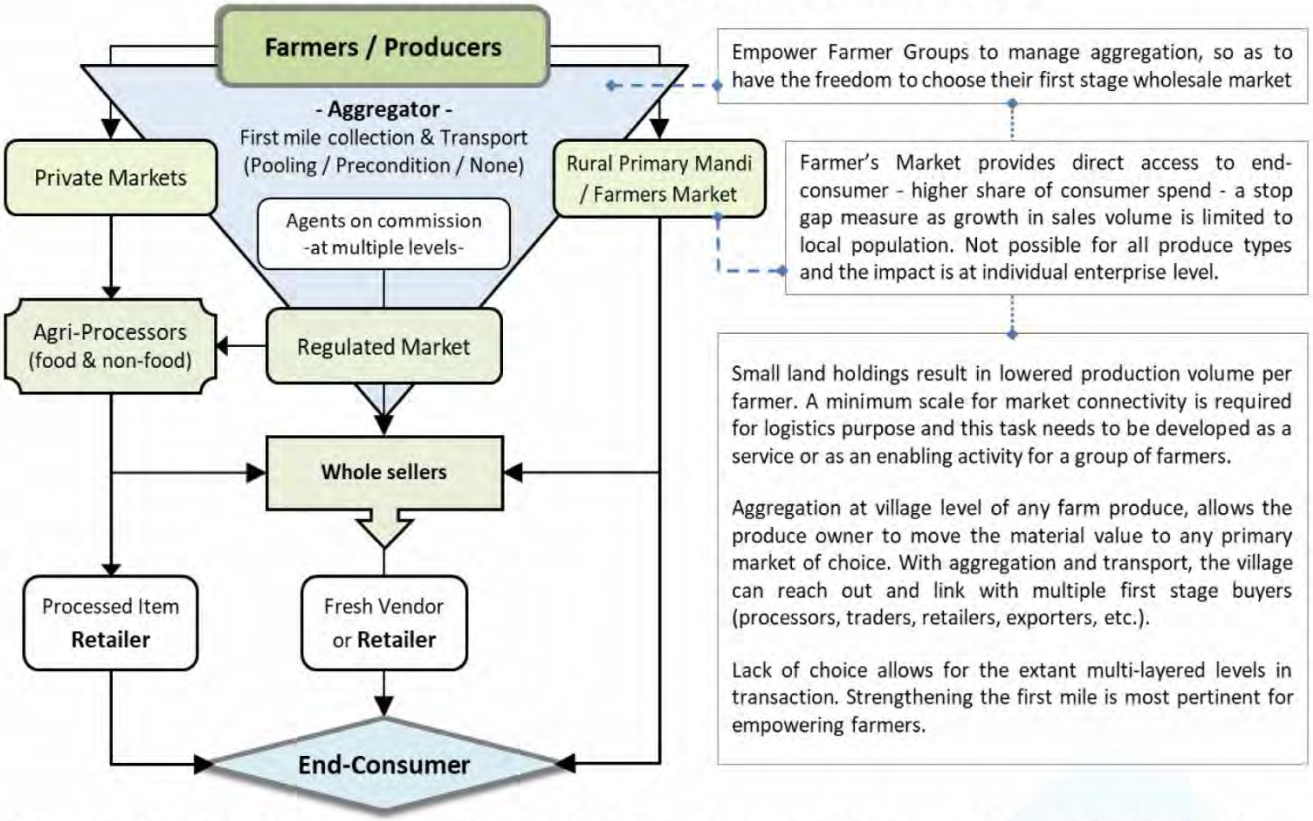
Another concern is the loss of agricultural produce on its way from farm to consumers. Such loss, that is said to 'range between 15 to 20%, is attributed to bottlenecks in post-harvest connectivity'[xiv] to markets. Perishables such as livestock produce, vegetables and fruits form a significant part of this loss.

The adverse impact of climate change on crop production is another worrisome phenomenon. Integration of adaptation and mitigation strategies to encourage requisite investments in 'climate smart agriculture'[xv] have become critically important. In this regard, the need for tapping clean renewable energy sources and more importantly promote water conservation has been emphasized to reduce the carbon footprint and hence the associated risks.

The agriculture sector in India is committed to achieving the United Nations 2030 Sustainable Development Goal (SDG) 2 of 'Zero Hunger'. As the country recovers from the impact of COVID-19, agricultural practices in the country have to ensure generation of economic livelihoods of farmers. At the same time, the focus has to be also on minimizing use of harmful or synthetic inputs and on-farm resources through organic farming. Dovetailed with climate smart agriculture, the latter has to enable production of affordable, nutritious and sustainable crops to our citizens.

A target has been set by Government of India to double the farmers' income by 2022. Therefore, the 'Report of the Committee on Doubling Farmers Income (DFI)'[xvi] assigns the highest priority to interventions that will eliminate constraints faced by small and marginal farmers and other stakeholders in the 'agricultural value chain.'[xvii] Such a value chain includes input provision/use, production, post- harvest processing/ storage and transportation/marketing/sales through requisite investments. The Report further outlines the importance of improving net returns to such farmers in this chain by lowering costs through their aggregation into collectives (Please see Figure 1).

Figure 1: Next Step Interventions for Farmer Groups



(Source: Report of the Committee of Doubling Farmers Income, Volume III, August 2017)

The 'DFI Report 2017'[xviii] also states that sustainable agriculture entails management of resources for agriculture that aim to produce food that is both nutritious and without contents that might harm human health. In practice, the Report adds, such an approach avoids the use of synthetic fertilizers, pesticides and instead relies on crop residues, animal and green manures.

In the above backdrop, there is a dire need, first and foremost, to further strengthen the access of small and marginal farmers to agricultural credit, inputs, technology and 'extension services.'[xix] At the same time there is a need to plug bottlenecks in transaction costs associated with their market entry and attaining economies of scale. To do so, aggregation of farmers into Farmer Producer Organizations (FPOs) and more specifically Farmer Producer Companies (FPCs) has been suggested by experts as the way forward (Singh, 2013).

Herein, small and marginal farmers jointly access input resources and also market their produce. With other requisite backward and forward linkages, such as availability of credit and robust extension services, aggregated small and marginal

farmers are to be the fulcrum of future agricultural growth in the country. This, experts contend, will empower them, as business entrepreneurs, to connect effectively to domestic and global markets and hence raise their incomes manifold.

Infact, unleashing of such agribusiness entrepreneurial spirits is at the core of the announcements made by Government of India for the agricultural sector under the '*Atma Nirbhar Bharat Krishi Package*'.[xx] This package intends to transform small and marginal farmers into vibrant producers through a barrier free agricultural eco system with availability of funding for infrastructure. The aim is also to enhance the resilience of India's agri-food system through promotion of good agricultural practices and further reducing its environmental footprint through organic farming.

STRUCTURE OF THE REVIEW PAPER

In the above context, this review paper is structured as follows. First, in the backdrop of the synergies between the Cooperative Movement and FPOs, it attempts to specifically delineate the role of FPCs in providing market access and empowering small and marginal farmers in India. Second, it highlights the importance of the agriculture produce cluster rationale. Third, it outlines the legal framework to constitute FPCs and their essential statistics. It also highlights the guidelines and schemes announced by Government of India to support them from time to time. Fourth, it probes some critical issues raised by experts in the setting up and last mile functioning of these producer companies especially easy access to credit. Fifth, it expands upon the organic farming forays in India and related productivity issues. In this context, it also shares information about a few organic farming FPC from across the country exploring key operational issues focusing on sustainable agricultural practices. Finally, the paper arrives at conclusions on the way forward to strengthen such producer companies by forging last mile convergences and plugging information asymmetries in agriculture produce clusters.

APPROACH AND DATA SOURCES

The approach of this review paper is essentially analytical. Through such an approach it aims to delineate issues and challenges in empowering small and marginal farmers to strengthen nutritional security through the sustainable agricultural practice of organic farming. The study is based on secondary data of annual reports, books, journals and published articles including online resources.

COOPERATIVE MOVEMENT AND FPOs

The review of literature for this paper reveals that the discussion on FPOs and more specifically FPCs is embedded in the discourse, policy and practise of the 'Cooperative movement'[xxi] in India.

The first cooperative act was legislated in British India in 1904. Producer organizations in the form of producer cooperatives have existed over hundred years ever since then. Infact, 'Primary Agricultural Credit Societies (PACS) are one of the oldest forms of producer organization'[xxii] at the village level addressing the rural credit needs of small and marginal farmers. Similarly, *Amul* became India's largest dairy food product marketing cooperative. To replicate its success, the National Dairy Development Board (NDDB) was set up and it launched Operation Flood to create farmer milk cooperatives across the country.'[xxiii] Hence, ever since independence, Government of India has provided massive financial, technical and administrative support to co-operatives both directly and indirectly through State governments (Dwivedi, 1996).

FPOs, in the above context, are aggregation institutions that aim at connecting the small and marginal farmer to both input and output markets. Such organizations are initiated either by the government, cooperative institutions, private sector, civil society, trusts and statutory societies. 'There forms include agricultural cooperatives, producer companies, self-help groups, federation of self-help groups, common interest groups, farmer interest groups, commodity interest groups, joint liability groups, farmers clubs etc. These forms vary in terms of membership and geographic spread.'[xxiv]

A fundamental basis is that farmer producers with common interests agree to pool their resources and jointly manage farming issues of credit, input sourcing, deployment of farm technology and post-harvest handling. They also manage dissemination of market information, good agricultural practices, participation in 'commodity exchanges'[xxv] and 'exports'.[xxvi] 'Farmer members, herein thus can seek reduction of transaction costs by leveraging their collective and bargaining strength to access financial inputs. At the same time, they can, on equitable terms, tap high value markets through business partnerships with myriad entities.'[xxvii]

THE AGRICULTURE PRODUCE CLUSTER RATIONALE

Grouping farms together to operate as a produce specific cluster with contiguous tracts of land has also been argued as the concept behind forming of FPOs. 'Such an approach is necessary to bring about a critical economy of scale at the farm gate so that farm inputs can be better managed, the cultivation gets consolidated care and the output from farms has a viable scale for post- production handling. More importantly, production from collaborative farming is to be linked to multiple demand centres (including proximity to urban centres) for quick evacuation of produce and to further maximize market opportunities.'[xxviii]Such produce clusters can span across villages, blocks and even districts.

LEGAL PROVISIONS

As has been explained in the preceding paragraphs, while an FPO is a generic name that represents different forms of community organizations/enterprises, a "Producer Company" is a special case of a producer enterprise that is registered as a body corporate under Section IXA of the Companies Act, 1956 (now Companies Act, 2013 as amended in 2002).

An expert Committee led by noted economist Dr. Y. K. Alag recommended setting up of such companies by incorporating Part IXA in the Companies Act, 1956. Such a producer company's main activities consist of 'production, harvesting, processing, procurement, grading, pooling, handling, marketing selling, export of primary produce of the members or import of good and services for their benefit. It also includes promoting mutual assistance, welfare measures, financial services, insurance of producers or their primary produce.'[xxix]

FPCs constitute of only primary producers to participate in the ownership and management of the company. Thus, members necessarily have to be persons engaged in any activity with or related to primary produce which in the case of this review paper are agriculture and allied activities. Besides, 'primary producers share profits among its members. Such producers are shareholders in the company and remaining profits are added to the organizations owned funds for business expansion.'[xxx] It has been aptly stated that FPCs are formal autonomous, outward oriented organizations and can be regarded as a hybrid between private companies and cooperatives (Trebbin, 2014).

A study has been conducted by the 'National Bank for Agricultural and Rural Development'[xxxi] (NABARD) to analyse design variables of FPOs (and FPCs) and their dynamic interrelationships. It states that 'the optimal position of key variables of size, scope, technology, ownership and management has to be such that the FPO (and FPCs) evolves as a sustainable community enterprise system. Also, that it can serve as a single window service centre to all farmers/producers in a cluster of villages or a Gram Panchayat.'[xxxii] Thus, with the cluster approach as the growth driver, this review paper, in context of various policy variables, will delve deeper into the issue raised by NABARD study while suggesting the way forward to strengthen these companies.

AGENCIES INVOLVED IN PROMOTION OF FPCs

Over the years, FPCs have been supported by Government of India, NABARD, Ministry of Rural Development, Ministry of Agriculture & Farmers Welfare, 'Small Farmers Agribusiness Consortium (SFAC)'[xxxiii] and state governments. Several international organizations such as International Fund for Agriculture Development (IFAD), Food and Agriculture Organization (FAO), United Nation Development Program (UNDP), World Bank etc have also been supporting them.

A pilot project was launched by The Department of Agriculture, Cooperation & Farmers Welfare, Ministry of Agriculture & Farmers Welfare, Government of India for promoting FPOs (including FPCs) during 2011-12. This was implemented through SFAC in partnership with the state governments. This involved mobilization of farmers into FPOs under two sub schemes of the Rastriya Krishi Vikas Yojana (RKVY) namely the National Vegetable Initiative for Urban Clusters and the Promotion of Pulses Development for rainfed villages. Subsequently, in 2013 the Ministry issued Policy & Process Guidelines 'detailing the vision, mission, scope and coverage of both FPOs and FPCs.'[xxxiv]

The Ministry of Food Processing Industries (MOFPI) is currently implementing schemes such as 'Operation Greens and Kisan SAMPADA Yojana'[xxxv] that provides effective and seamless backward and forward linkages including agri- logistics for the processed food industry. This is to facilitate involvement of farmers and more importantly, farmer producer companies. Similarly, under the 'Deendayal Antoyada-National Rural Livelihood Mission (NRLM)'[xxxvi], the Ministry of Rural Development, Government of India has taken up value chain development interventions. These too are to be taken up through farmer producer companies to enable small and marginal farmers to access markets for better price realization.

ESSENTIAL STATISTICS ON FPOs/FPCs

Review of literature reveals the presence of multitude sources for essential statistics on FPOs/FPCs. A National Institute of Agricultural Extension (MANAGE) report states that 'presently approximately 5000 FPOs (including FPCs) formed under various initiatives of the Government of India, SFAC, NABARD, State governments and other organizations are in existence in the country. Of these, around 3200 FPOs are registered as Producer Companies and the remaining as Cooperatives/Societies.'[xxxvii]

An Ernst & Young LLP and FICCI study highlights that 'there are approximately more than 2000 FPCs promoted by private institutions/trusts such as Bill & Melinda Gates Foundation, TATA Trust, Reliance Foundation, Axis Bank Foundation, Ambuja Foundation, HDFC Foundation, Syngenta Foundation etc. These cover approximately 2% cultivars in the country.'[xxxviii]

Azim Premji University has published a study that states that "there are 7374 producer companies registered as on March 31st, 2019 with 4.3 million estimated members. 92% of these producer companies are farm based. The average number of FPCs per one lakh farmer is 2.6 that is for every 100,000 agricultural workers in India there are 2.6 farmer producer companies. These also include self- promoted FPCs by large farmers. Maharashtra has by far the largest number of producer companies followed by Uttar Pradesh, Tamil Naidu and Madhya Pradesh. The district with the largest number of producer companies is Pune followed by Ahmednagar and Nasik.'[xxxix] It is evident from the above that there is dire need for availability of a single source of such data and statistics on FPCs at the national level. More so, as an "e-platform," for use by various stakeholders, experts, professionals and scholars alike. Also see Table 1

Table-1: State Wise Coverage of Farmers in FPOs as on 31.03.2021

S. No	State/UTs	Total No. of Farmers Mobilized
1	Andhra Pradesh	13618
2	Arunachal Pradesh	4270
3	Assam	10831
4	Bihar	36423
5	Chhattisgarh	29436

(Source:http://sfacindia.com *Small Farmers Agri Consortium*)

SCOPE OF FUNCTIONS OF FPCs

There is tremendous heterogeneity in the operations of FPCs. According to the Azim Premji University study 'FPCs can work either with a single agricultural commodity or multiple commodities. Many FPCs are engaged in bulk procurement of inputs while others are acting as intermediaries in the value chain by aggregating produce from small and marginal farmers and doing some primary processing (such as grading and sorting). A few FPCs are engaged in higher forms of value addition such as pulping or juicing of fruits, chopping and freezing of vegetables etc. Some FPCs are producing ready to eat/cook products and non-food items such as vermi-compost, mosquito repellent cow dung cakes'[xl].

The study further adds that 'other FPCs have obtained a licence to become nodal agencies for procurement of agricultural commodities at Minimum Support Price (MSP). A few others have become licenced agencies of agricultural manufacturers or crop insurance companies. They sell their produce in wholesale mandis, to large traders, restaurants, hotels, corporate bulk buyers or directly to consumers. A few FPCs and their promotors go beyond business activities and do advocacy, education and knowledge creation.'[xli]

It's quite evident from the scope of above operational functions that FPCs are working across the agricultural value chain spectrum in the country. It has been argued that despite a head start, they still require not just capital, infrastructure and market linkage backing but handholding too for sustaining their business operations. Infact, 'there is a need to establish incubators to handhold and support FPCs and different modes and categories for financing them.'[xlii]

CRITICAL ISSUES

Experts opine that FPCs have the potential to give higher income by reducing cost of production and higher price realization to farmer producers through better market access (Markelova et al., 2009; Valentinov 2007). But for this potential to be fully tapped, a few critical pre-formation and post-formation challenges have to be addressed.

10

PRE-FORMATION

Despite the fact that the role of the implementing/promoting agency is critical the 'business rationale for aggregation in an FPC is usually formed on the objectives laid out by the former.'[xliii] This at times is exacerbated by lack of a thorough pre-feasibility study and specific mission needs in the context of the 'agro-climatic regions.'[xliv] The FPCs growth is therefore quite dependent on handholding by the implementing/ promoting agency. Besides, many times, lack of State government incubators for handholding support limits the exposure of small and marginal farmers to modern technology and crop development.

POST-FORMATION

At times, access to credit from banks and financial institutions due to 'lack of financial literacy acts as a hinderance.'[xlv] There could also be bottlenecks in availability of timely market information. This has a direct bearing on non-preparation and implementation of feasible business plans. The lack of professional staff also hinders the latter. In addition, the lack of a well mapped eco system of 'storage'[xlvi] and primary processing infrastructure is also an issue.

The key area of output marketing, experts add, has critical interdependencies with day-to-day management of and access to finance by the FPCs. Farmers usually are efficient producers but lack of a business sense inhibits them towards entering post-harvest management value chain activities. 'Many a times, lack of cash surplus limits the FPCs capacity to undertake marketing activities and infact, meet bulk and year-round orders. Rarely, do FPCs take up independent performance rating by outside agencies to access credit.'[xlvii]

Finally, training, skilling and capacity building for FPC members, it has been argued, does not fully focus on execution of agricultural business operations. This includes knowledge areas both of 'soft and hard skills such as leadership, networking, negotiation, pricing, business planning, brand building etc.'[xlviii]

The TATA-Cornell Institute for Agriculture and Nutrition in its 'Policy Brief 2019'[xlix] points out that the biggest challenge for FPOs/FPCs has been accessing credit since Bank-FPO linkages are poor. The major lenders, according to the Brief, have been Non- Banking Financial Companies (NBFCs) that provide short term advances and loans at high rate of interest to more established FPOs/FPCs.

THE NEW AGRICULTURE INFRSTRUCTURE FUND (AIF)

In this context, the setting up of the US $ 14 billion 'Agricultural Infrastructure Fund (AIF)'[l] by the Ministry of Agriculture & Farmers Welfare, Government of India is a step in the right direction. It aims at mobilizing investment, through both incentives and financial support, in viable projects relating to post harvest management and community farming assets. The Fund has two innovative features. One, its focus on creation of farm-gate infrastructure with appropriate technologies such as village warehouses, modern packhouses (for primary processing such as sorting, drying, grading etc.) and cold chains (integrated logistics supply of cold stores that includes, modern pack houses, refrigerated transport and ripening units). This will enable farmers to sell directly to bulk buyers, processors and consumers. Second, it provides both for provision of interest subvention and credit guarantee. Ultimately, through the aegis of this Fund what one is looking at is the creation of a robust ecosystem for agribusiness through funding of PACs, FPOS/FPCs, agri entrepreneurs and startups that in turn will empower farmers, especially small and marginal farmers.

Infact, in this context, experts have also flagged the importance of creation of employment opportunities for women and young farmers. They state that with requisite and well-planned pan India investments through AIF, 'logistics like aggregation, storage, processing etc. at the agribusiness upstream and food related services at the downstream can be leveraged as a channel of employment generation'.[li]

NEW FPO POLICY GUIDELINES

To supplement the above pan India instrument of funding, a dedicated 'Central Sector Scheme for formation and promotion of 10,000 FPOs'[lii] across the country has also been launched in 2020 by the Ministry of Agriculture & Farmers Welfare, Government of India. It provides handholding and support to FPOs up to five years. There will be three implementing agencies, namely, SFAC, NABARD and the 'National Cooperative Development Corporation (NCDC).'[liii]

The new scheme has a few distinctive features. First, it makes a produce cluster area an essential for FPO formation that includes organic and natural farming (making it possible to achieve synergies with the 'One District One Product'[liv] approach for development of agri product specialization). Second, it provides for setting up special purpose Cluster Based Business Organizations. Such entities will assist the

12

implementation agency in entry point activities, farmer mobilization, conduct of feasibility, baseline surveys and most importantly in preparation of core business plans for medium- and long-term development. Third, reimbursement of funds will also be available to value chain processing and export entities that are supporting FPOs through cluster approaches. Fourth, there is availability of equity grants and credit guarantee cover for accelerated flow of institutional credit to FPOs.

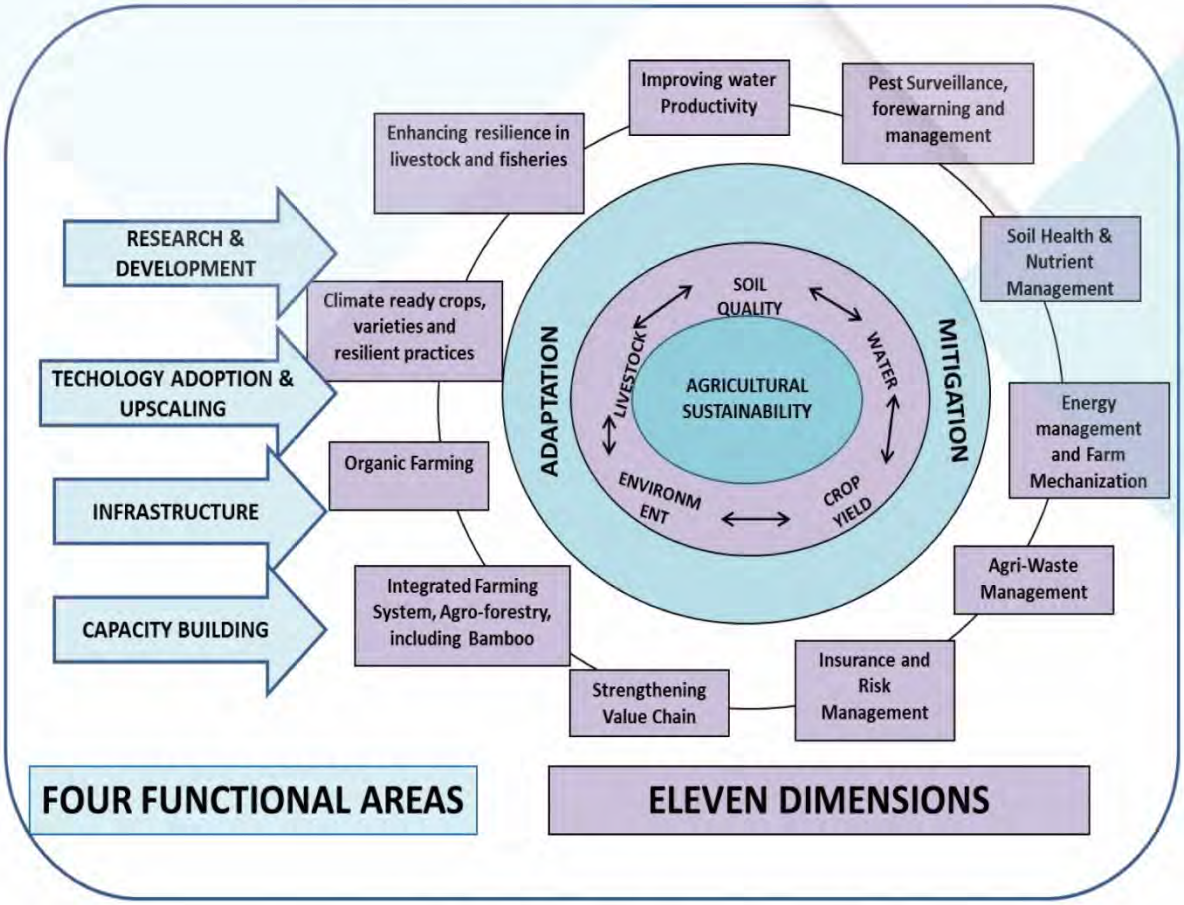
Existing FPOs will also be allowed to avail benefits, if they have not done so under any scheme of Government of India such as Credit Guarantee Fund and seeking advisory services from the National Project Management Agency (NPMA). Those FPOs that are already registered but have not been provided funds under any other schemes and have not started operations will also be covered.

Last but not the least**,** the Scheme also provides for robust capacity building interventions and a wholistic monitoring governance structure with central, state and district level committees. More importantly, in view of the lacunae pertaining to databases pointed out earlier, it provides for an integrated and interoperable national portal so that relevant databases on FPOs/FPCs are uniformly available to all concerned.

ORGANIC FARMING ISSUES AND SCHEMES

The 'National Mission for Sustainable Agriculture (NMSA)'[lv] is a programmatic intervention operational since 2015 in the country. It aims at making agriculture climate resilient through a comprehensive soil health management and integrated farming approach of which organic farming is a critical component (Figure 1).

Figure 2 NMSA Strategy



(Source: Annual Report 2020-21; DAC&FW)

In India there has been steady increase over the years in the extent of organically farmed land and hence research devoted to such farming and its market size. Currently, '3.8 million hectares of cultivable area is organically farmed by 3 million farmers with an export and domestic demand of approximately USD 940 million and USD 590 million respectively'[lvi]. We export organic oilseeds, oilcakes, cereals, sugar, fruit pulp and spices to destinations such as USA, European Union (EU) and Canada. Among the states Madhya Pradesh, Rajasthan, Maharashtra, Odisha, Karnataka, Uttarakhand and Uttar Pradesh have substantial area under organic cultivation. Major crops grown include cotton, paddy, wheat, pulses, millets, vegetables, fruits, cereals, oilseeds and sugarcane.

India has a sizable extent of cropped area in different states that are prone to weather uncertainties. These are areas located in rainfed, dryland and hilly tracts. Experts content that in these areas the use of fertilizers and pesticides is much below the national average. Hence, they suggest that these are the areas that need to be

intensively further targeted for organic production by devising appropriate strategies to identify *niche crops.* The ODOP initiative by Government of India, listing agro-climatically suitable crops for which niche demand can be further invigorated, is a step in the right direction. It can be dovetailed by states to strengthen their organic production plans with requisite package of practices to increase agricultural productivity as well as conserve precious soil resources.

Another critical issue flagged by experts is the drop in yield (also reported by farmers) during the conversion stage from conventional to organic agriculture. In this context, the example of Sikkim, India's fully organic state is very relevant. The DFI Report observes that productivity of rice in Sikkim continued to increase in 2013-14 as compared to 2002-03 when fertilizer consumption was very high in the absence of an organic mission mode. This only goes to indicate that with consistent and improved farm management practices yield levels can be increased in organic production. These include good quality compost generation, green manures, use of bio-fertilizers, mixed cropping (e.g., legumes in rotation with cereals/vegetable crops) and pest/weed control. This also reduces climate change factors such as greenhouse gas emissions from farmlands significantly.

Infact, under the NMSA strategy through schemes such as Paramparagat Krishi Vikas Yojana (PKVY), Mission Organic Value Chain Development North East (MOVCDNER) and National Programme of Organic Farming (NPOP) Government of India promotes nutrient management through low input cost organic farming. It supports farmers by giving impetus to a cluster approach through formation of Farmer Producer Organizations (FPOs), develop value chains and enabling market linkages. A '*javikkheti'* web portal infact connects farmers to consumers for better prices. In addition, the Indian Council of Agricultural Research (ICAR) also runs a national programme to develop location specific package of practices for organic cropping systems. PKVY has peer appraised self-certification while MOVCDNER and NPOP use third party certification. A Large Area Certification (LAC) programme has also been initiated in 2020-21 that aims to certify large traditional organic hills, islands, tribal and desert areas with no past history of agro-chemical use.

FPC BEST PRACTICES IN SUSTAINABLE AGRICULTURE

There are several examples of good practices in the field wherein FPCs, in a variety of institutional settings have enabled market access to small and marginal farmer members for both input supply and output marketing. They have also fostered

nutritional security through the sustainable agricultural practice of organic farming. These practices also address some of the critical pre and post formation issues mentioned earlier in this review paper. More importantly, they reiterate the importance of key issues integral to organic farming such as the cluster approach, nutrient management, quality control, social inclusion and use of appropriate technologies.

The Government of Haryana has recently launched an innovatively modelled 'Crop Cluster Development Program'[lvii] to give a big push to primary processing facilities in horticulture crop clusters through FPCs. These 140 clusters have been identified by surveying and mapping villages across the state for fruit and vegetable crops. Within these clusters, integrated pack houses for sorting and grading will be managed and run by FPCs. These are bank appraised projects with credit link subsidy. Inhouse information technology linkages through e-services and deployment of outsourced cluster/district-based project extension managers are the program's forte. With extensive incubating facilitation by the State SFAC, two FPCs namely, Javik Aahar Farmer Producer Company, Jhajjar and Safe Agro Producer Company, Hisar have begun operating integrated pack houses in their respective clusters.

The 'Marutham Sustainable Agriculture Producer Company'[lviii] works with 9000 farming families across 38 rural local bodies in Kanchipuram District of Tamil Naidu. Taking up the challenge of promoting enrichment of soil fertility led the FPC to set up two field level units- *neem*-based and vermi-composting. *Neem* products are used for pest control, seed storage and as fertilizers. Vermi-compost is procured by the FPC from members and non-members and sold as a business activity. The FPC also promotes home gardens of chemical free vegetables for landless women for nutritional improvement and as an income supplement. With the above initiatives the net return to farmers has risen up to 15% and per hectare productivity has risen by 10%.

Over 4000 Women primary producers are members of the 'Dev Bhumi Natural Products Producer Company'[lix] functioning in Pauri Garwal and five other districts of Uttarakhand. It is a community owned enterprise. Its core activities include sericulture, organic honey and eco-tourism. Besides, highly priced organic spices and kidney beans, indigenous to Himalayan regions are also grown, processed and marketed by the Company. Its hallmark has been an 'inclusive approach'[lx] while 'accessing remote villages coupled with assisting primary producers to leverage

financial resources from NABARD and Friends of Women World Banking (FWWB)'.[lxi] The entity also produces and processes organic pulses, finger millets, ginger and garlic. More importantly, it supports its stakeholders through various stages of the value chain i.e., processing, packaging, branding and distribution and not just the supply side.

Concerns such as the ill effects of high agrochemical use on health and the environment has brought together a community owned enterprise, 'Sahaja Aharam' in Telengana. The 'Sahaja Aharam Producer Company'[lxii] (SAPCO) sells organic produce directly through its owned and franchised stores. The entity is a federation of registered producer cooperatives whose members are practicing organic farming. While market linkages are created for all farmers for their produce, the value addition and retail marketing support are restricted to the farms which have been organic for three years with due certification. A key aspect is the application of appropriate technology for traceability. Each packet sold at the Sahaja Aharam stores can be traced back to the farmer group which has grown it. Besides, a methodology has also been developed to quantify the ecological footprints of the food before it reaches the consumers.

World Bank's 'South Asia Agriculture and Rural Growth Discussion Note Series (2020)'[lxiii] highlights the case of Jharkhand State wherein labour force relies on agriculture and allied sectors and small and marginal farmers practice rainfed single crop subsistence farming. The 'Johar Project' was initiated in 2017 by World Bank (it builds on the work of the National Rural Livelihood Mission-NRLM and the State Government) to aid targeted rural producer households to diversify and enhance their household incomes.

The Note Series state that the project has operationalized 19 out of 30 FPCs covering two lakh households by a marketing initiative for post- harvest management for tomatoes. Setting up of the FPCs led to putting in place of a technical support agency, package of practices, market intelligence system, business process, communication and marketing plan in addition to monthly group meetings of farmers. Bringing FPC and market leaders together through a buyer-seller meet was another intervention. Key results included selling of 263 metric tonnes of tomatoes worth INR 5.1 million by three piloting FPCs during the intervention period following the process driven aggregation and sales.

One of the key learning from the functioning of Johar Project FPCs, the Note Series observe, was that simple principles related to sorting, grading and packaging helped the FPCs to create a niche for tomatoes in wholesale markets. This also created a positive impact on farmers to supply graded products.

The above good practices and many more in the countryside provide a snapshot of myriad institutional settings and operating models of FPCs. Experts have further pointed out two important issues. First that the 'rising demand for diversified foods has led to a growing emphasis on grades and standards to ensure quality, health, safety and differentiation of products based on tastes and preferences.'[lxiv] This issue is in fact, extremely critical in context of the role of FPCs in providing farmer member producers access to the fast-growing organized retail market in food and groceries based on requisite quality standards, especially for organic products.

Second, experts also observe that viability of an FFC is a very critical issue and may depend upon its operating mode and availability of funds (the new FPO/FPC Guidelines and setting up of AIF in 2020 provide for very effective loan disbursement, interest subvention, equity grant and credit guarantee mechanisms). They suggest that to be a viable entity there should be 'a two-pronged FPC promotion strategy: the first of supplier FPCs by NGOs and resource institutions who are good at producer mobilization with good ground knowledge and second to bring in business expertise to establish smaller market facing companies with adequate capital and skilled talent.'[lxv]

WAY FORWARD

The nuts and bolts of above examples and issues raised bring us to the fundamental question of 'strengthening the sustainability of FPCs to provide a stable relationship between the small producer (farmers) and large markets.'[lxvi] Sustainability of FPCs has to be seen from the perspective of forging last mile convergences and plugging information asymmetries for the cluster approach in organic farming to succeed as a growth driver.

The first key issue is the need to strengthen the interface mechanism between the Indian Council of Agricultural Research (ICAR) institutes especially '722 Krishi Vigyan Kendras'[lxvii] (KVKs), the district administration (through District Magistrates/ Collectors/ Deputy Commissioners) and the small and marginal farmers as primary producer members of FPCs in produce clusters. They together have to take into

account the changing agro-ecological ground realities. Especially the need for intensively adopting climate smart agricultural practices while planning and operationalizing input and primary processing activities. Such practices include zero tillage, crop residue management, micro irrigation, use of information and communication technologies-based weather advisories, energy efficient pack house operations etc.

KVKs will also need to effectively utilize advise of local agri-business/industry entrepreneurs in FPCs and '261,967 Panchayat Raj Institution'[lxviii] (PRI) leaders in districts. They must strive to formalize one key activity in their 'demonstration trial' and outreach functions in produce clusters. And this is the mapping, coordinating and sharing with small and marginal farmers, the work and experience of numerous organic farming *agri-startups* in districts (specially in hilly, desert, tribal and aspirational districts identified by Niti Aayog having low socio-economic indicators). These startups, like several FPCs, are using innovative methods and low-cost technologies to introduce automated supply chain efficiencies and hence ensure better price realization for farmers.

Second, the communication interface of FPCs with PRIs at all levels of administrative units- the village, block, and district (more so at the level of a village or group of villages) needs to be aligned in produce clusters. There is tremendous penetration of broadband connectivity and mobile usage at all levels of the administrative units. Despite that, physical reach of sufficient numbers of field extension officers of agriculture, horticulture, fisheries, forestry and animal husbandry departments at all levels can complement and supplement the extension work of FPCs. In addition, the efficient dovetailing of Common Service Centers (CSCs) to FPC operations is very critical. CSCs are essential single window access points in districts that provide high quality and cost-effective video, voice, data content along with public utility services to farmers.

Further, PRIs, as legally empowered decentralized institutions, have to work towards incubating databases and good practices of FPOs and more specifically FPCs. This can also include work of FPC being handheld by non-governmental organizations (NGOs). Deepening such a capacity within all levels of PRIs (*Zilla Parishad, Panchayat Samiti, Gram Panchayat*) in produce clusters is bound to enable them to make realistic assessment of the required appropriate pre- and post-harvest management agricultural practices and technologies. Thereafter, widespread availability and

application of these interventions for small and marginal FPC member producers can be enabled by overcoming the constraint of funding through the aegis of the new FPO Guidelines and AIF.

Such a converged cluster approach can provide FPCs the robust ecology to empower small and marginal farmers who have no prior experience in business activities. More so, when it involves adoption of agricultural package of practices to collectively take up organic farming and consequently seek quality certification. Recently there has been nationwide enactment of two historic Acts namely the Farmers Produce Trade and Commerce (Promotion and Facilitation) Act 2020 and the Farmers (Empowerment and Protection) Agreement on Price Assurance and Farm Services Act 2020 under the *Atma Nirbhar Bharat Krishi Package.* The Acts' guiding principle, as also envisioned by the DFI Committee Report, is creation of market access for small and marginal farmers through barrier free trade in agricultural produce and engagement with sponsors of their choice. In other words, a sustainable agricultural eco-system that strengthens organic farming policies and institutional interventions that are market oriented yet inclusive.

ENDNOTES

[i] The agriculture and allied sectors consist of four sub sectors namely, crop sector, livestock sector, forestry and fisheries. These sub sectors share in value of production is 61.31%, 26.80%,7.39% and 4.50% respectively. Horticulture crops that include fruits and vegetables contribute 25.17% (second highest in crop sector). Field crops include cereals, pulses, oilseeds, sugars, fibres. For more information see *Report of the Committee on Doubling Farmers Income*, Department of Agriculture, Cooperation & Farmers Welfare, Ministry of Agriculture & Farmers Welfare, Government of India, Volume I, Chapter 2 (New Delhi, August 2017), pp.26-29.

[ii] The Green Revolution in India began in the mid-1960s through the introduction of high yielding varieties of crops. It increased farm productivity substantially over the years and turned India into a leading producer of food grains. For more information see. B.P. Bhatt, J.P. Mishra, Amitava Dey, A.K. Singh and S.Kumar, *Second Green Revolution in Eastern India: Issues and Initiatives*,(Bihar: ICAR, 2016), p3.

[iii] Gross Value Added (GVA) is a measure of value of goods and services produced in an area, industry or sector of the economy. In national accounts, GVA is output minus intermediate consumption. It came to be introduced in January 2015. *State of Indian Agriculture*, Department of Agriculture, Cooperation & Farmers Welfare, Ministry of Agriculture & Farmers Welfare, Government of India (New Delhi:2017). p.1.

[vii] Entry 14 of List-II (State List) of Constitution of India provides for agriculture including agriculture research, protection against pests and prevention of plant diseases to be in the preview of States. Hence, pre-production, production and harvesting clearly remains a state subject. When it comes to deal with harvested produce, States have enacted an Act on agricultural marketing by exercising powers conferred under Entry 28- "Markets and Fairs" of the VII Schedule of the Constitution of India. For more information see *The Constitution of India*, Government of India, Ministry of Law & Justice. (New Delhi, 2011), pp.270-272

[viii] The current marketing system comprises about 2,284 regulated Agricultural Produce Marketing Committees (APMCs) which operate 2339 principal markets. These markets have extended their footprint through 4276 sub-markets yards. On an average the market yards cover 463 square kms of geographic area or a radius of 12 kms. These are further categorized as primary, secondary or terminal markets depending upon their location and volume being handled. There are also 22,932 rural periodical markets owned and managed by State Marketing Boards, APMCs, Panchayats and Municipalities. For more information see *Report of the Committee on Doubling Farmers Income*, Department of Agriculture, Cooperation & Farmers Welfare, Ministry of Agriculture & Farmers Welfare, Government of India, Volume IV. Chapter 5 (New Delhi, August 2017), pp.58-59.

[ix] As many as 113 Research Institutes/ Indian Council of Agricultural Research (ICAR), 77 State Agricultural Universities (SAUs)- Central Agricultural Universities (CAUs), 700 Krishi Vigyan Kendras (KVKs) in Districts Commodity Boards etc. are involved in generation of transferable technologies. For more information please see *Report of the Committee on Doubling Farmers Income*, Department of Agriculture, Cooperation & Farmers Welfare, Ministry of Agriculture & Farmers Welfare, Government of India, November 2017, Volume XI, Chapter 1 (New Delhi, November, 2017), p.1.

[x] There are 14 schemes of the Department of Agriculture and Farmers Welfare onboarded to direct benefit transfer including PM-KISAN under which Rs, 17,000 crore has been released to more than 8.5 crore farmers. *Annual Report 2019-20*, Department of Agriculture & Farmers Welfare, Ministry of Agriculture & Farmers Welfare, (Krishi Bhawan: New Delhi. p.23 and visit link www.agricoop.nic.in last accessed on 9th September, 2020

[xi] National Agricultural Market is a virtual market but has a physical market at the backend. Therefore, while one-time registration of farmers/sellers, lot details at the entry gate, weighment, quality essaying, auctions, payments will take place online, actual material flow will happen in the regulated market. For more information please see *Operational Guidelines for Promotion of National Agricultural Market* (New Delhi: September, 2016). p.1

[xii] There are approximately 450 agri-tech start-ups in India providing market linkage, digital access to inputs, financing etc such as Ninjacart, Crofarm, Cropin, Agnext, Agrostar, KhetiNext etc. NASSCOM Report on Agritech in India, 2019.
