TABLE 10 – Glyphosate Products Registered for Postemergence Applications in Glyphosate-Resistant Crops*

* Restricted entry interval = 4 hours

^a There may be some additional glyphosate products registered for use in Michigan not covered in this list. However, those products should have similar formulations to compare use rates.

^b ae = acid equivalent, lb of glyphosate acid per gallon.

^c Y = Yes, surfactant is needed; S = Sometimes under certain conditions additional surfactant may improve control; N = No surfactant is needed. For products that may need a surfactant, a non-ionic surfactant at 0.25 to 1% v/v is the typical recommendation. Consult the herbicide label to verify the type and rate of surfactant to include. AMS should be included with glyphosate in all applications at 17 lb/100 gal to improve activity, unless otherwise prohibited with certain tank-mix partners.
